

# Package ‘DatabaseConnector’

December 5, 2022

**Type** Package

**Title** Connecting to Various Database Platforms

**Version** 6.0.0

**Date** 2022-11-25

**Description** An R 'DataBase Interface' ('DBI') compatible interface to various database platforms ('PostgreSQL', 'Oracle', 'Microsoft SQL Server', 'Amazon Redshift', 'Microsoft Parallel Database Warehouse', 'IBM Netezza', 'Apache Impala', 'Google BigQuery', 'Snowflake', 'Spark', and 'SQLite'). Also includes support for fetching data as 'Andromeda' objects. Uses 'Java Database Connectivity' ('JDBC') to connect to databases (except SQLite).

**SystemRequirements** Java version 8 or higher (<https://www.java.com/>)

**Depends** R (>= 4.0.0)

**Imports** rJava,  
SqlRender (>= 1.11.0),  
methods,  
stringr,  
readr,  
rlang,  
utils,  
DBI (>= 1.0.0),  
urltools,  
bit64,  
checkmate,  
digest,  
dbplyr

**Suggests** aws.s3,  
R.utils,  
withr,  
testthat,  
DBItest,  
knitr,  
rmarkdown,  
RSQLite,  
ssh,  
Andromeda,  
dplyr,  
RPostgres,  
odbc,

duckdb,  
pool,  
ParallelLogger

**License** Apache License

**VignetteBuilder** knitr

**URL** <https://ohdsi.github.io/DatabaseConnector/>, <https://github.com/OHDSI/DatabaseConnector>

**BugReports** <https://github.com/OHDSI/DatabaseConnector/issues>

**Copyright** See file COPYRIGHTS

**RoxygenNote** 7.2.2

**Encoding** UTF-8

 assertTempEmulationSchemaSet

*Assert the temp emulation schema is set*

---

### Description

Asserts the temp emulation schema is set for DBMSs requiring temp table emulation.

If you know your code uses temp tables, it is a good idea to call this function first, so it can throw an informative error if the user forgot to set the temp emulation schema.

### Usage

```
assertTempEmulationSchemaSet(
    dbms,
    tempEmulationSchema = getOption("sqlRenderTempEmulationSchema")
)
```

### Arguments

dbms	The type of DBMS running on the server. See [connect()] or [createConnection-Details()] for valid values.
tempEmulationSchema	The temp emulation schema specified by the user.

### Value

Does not return anything. Throws an error if the DBMS requires temp emulation but the temp emulation schema is not set.

---

 computeDataHash

*Compute hash of data*

---

### Description

Compute a hash of the data in the database schema. If the data changes, this should produce a different hash code. Specifically, the hash is based on the field names, field types, and table row counts.

### Usage

```
computeDataHash(connection, databaseSchema, tables = NULL, progressBar = TRUE)
```

### Arguments

connection	The connection to the database server.
databaseSchema	The name of the database schema. See details for platform-specific details.
tables	(Optional) A list of tables to restrict to.
progressBar	When true, a progress bar is shown based on the number of tables in the database schema.

## Details

The databaseSchema argument is interpreted differently according to the different platforms: SQL Server and PDW: The databaseSchema schema should specify both the database and the schema, e.g. 'my\_database.dbo'. Impala: the databaseSchema should specify the database. Oracle: The databaseSchema should specify the Oracle 'user'. All other : The databaseSchema should specify the schema.

## Value

A string representing the MD5 hash code.

---

connect	<i>connect</i>
---------	----------------

---

## Description

connect creates a connection to a database server .There are four ways to call this function:

- connect(dbms, user, password, server, port, extraSettings, oracleDriver, pathToDriver)
- connect(connectionDetails)
- connect(dbms, connectionString, pathToDriver))
- connect(dbms, connectionString, user, password, pathToDriver)

## Arguments

connectionDetails	An object of class connectionDetails as created by the <a href="#">createConnectionDetails</a> function.
dbms	The type of DBMS running on the server. Valid values are <ul style="list-style-type: none"> <li>• "oracle" for Oracle</li> <li>• "postgresql" for PostgreSQL</li> <li>• "redshift" for Amazon Redshift</li> <li>• "sql server" for Microsoft SQL Server</li> <li>• "pdw" for Microsoft Parallel Data Warehouse (PDW)</li> <li>• "netezza" for IBM Netezza</li> <li>• "bigquery" for Google BigQuery</li> <li>• "sqlite" for SQLite</li> <li>• "sqlite extended" for SQLite with extended types (DATE and DATETIME)</li> <li>• "spark" for Spark</li> <li>• "snowflake" for Snowflake</li> </ul>
user	The user name used to access the server.
password	The password for that user.
server	The name of the server.
port	(optional) The port on the server to connect to.
extraSettings	(optional) Additional configuration settings specific to the database provider to configure things as security for SSL. These must follow the format for the JDBC connection for the RDBMS specified in dbms.

oracleDriver	Specify which Oracle drive you want to use. Choose between "thin" or "oci".
connectionString	The JDBC connection string. If specified, the server, port, extraSettings, and oracleDriver fields are ignored. If user and password are not specified, they are assumed to already be included in the connection string.
pathToDriver	Path to a folder containing the JDBC driver JAR files. See <a href="#">downloadJdbcDrivers</a> for instructions on how to download the relevant drivers.

## Details

This function creates a connection to a database.

## Value

An object that extends `DBConnection` in a database-specific manner. This object is used to direct commands to the database engine.

## DBMS parameter details

Depending on the DBMS, the function arguments have slightly different interpretations: Oracle:

- user. The user name used to access the server
- password. The password for that user
- server. This field contains the SID, or host and servicename, SID, or TNSName: '<sid>', '<host>/<sid>', '<host>/<service name>', or '<tnsname>'
- port. Specifies the port on the server (default = 1521)
- extraSettings The configuration settings for the connection (i.e. SSL Settings such as "(PROTOCOL=tcp)")
- oracleDriver The driver to be used. Choose between "thin" or "oci".
- pathToDriver The path to the folder containing the Oracle JDBC driver JAR files.

Microsoft SQL Server:

- user. The user used to log in to the server. If the user is not specified, Windows Integrated Security will be used, which requires the SQL Server JDBC drivers to be installed (see details below).
- password. The password used to log on to the server
- server. This field contains the host name of the server
- port. Not used for SQL Server
- extraSettings The configuration settings for the connection (i.e. SSL Settings such as "encrypt=true; trustServerCertificate=false;")
- pathToDriver The path to the folder containing the SQL Server JDBC driver JAR files.

Microsoft PDW:

- user. The user used to log in to the server. If the user is not specified, Windows Integrated Security will be used, which requires the SQL Server JDBC drivers to be installed (see details below).
- password. The password used to log on to the server
- server. This field contains the host name of the server

- `port`. Not used for SQL Server
- `extraSettings` The configuration settings for the connection (i.e. SSL Settings such as "encrypt=true; trustServerCertificate=false;")
- `pathToDriver` The path to the folder containing the SQL Server JDBC driver JAR files.

#### PostgreSQL:

- `user`. The user used to log in to the server
- `password`. The password used to log on to the server
- `server`. This field contains the host name of the server and the database holding the relevant schemas: <host>/<database>
- `port`. Specifies the port on the server (default = 5432)
- `extraSettings` The configuration settings for the connection (i.e. SSL Settings such as "ssl=true")
- `pathToDriver` The path to the folder containing the PostgreSQL JDBC driver JAR files.

#### Redshift:

- `user`. The user used to log in to the server
- `password`. The password used to log on to the server
- `server`. This field contains the host name of the server and the database holding the relevant schemas: <host>/<database>
- `port`. Specifies the port on the server (default = 5439)
- `extraSettings` The configuration settings for the connection (i.e. SSL Settings such as "ssl=true&sslfactory=com.amazon.redshift.ssl.NonValidatingFactory")
- `pathToDriver` The path to the folder containing the RedShift JDBC driver JAR files.

#### Netezza:

- `user`. The user used to log in to the server
- `password`. The password used to log on to the server
- `server`. This field contains the host name of the server and the database holding the relevant schemas: <host>/<database>
- `port`. Specifies the port on the server (default = 5480)
- `extraSettings` The configuration settings for the connection (i.e. SSL Settings such as "ssl=true")
- `pathToDriver` The path to the folder containing the Netezza JDBC driver JAR file (nzjdbc.jar).

#### Impala:

- `user`. The user name used to access the server
- `password`. The password for that user
- `server`. The host name of the server
- `port`. Specifies the port on the server (default = 21050)
- `extraSettings` The configuration settings for the connection (i.e. SSL Settings such as "SSLKeyStorePwd=\*\*\*\*\*")
- `pathToDriver` The path to the folder containing the Impala JDBC driver JAR files.

#### SQLite:

- server. The path to the SQLite file.

Spark:

- connectionString. The connection string (e.g. starting with 'jdbc:spark://my-org.dev.cloud.databricks.com...').
- user. The user name used to access the server.
- password. The password for that user.

Snowflake:

- connectionString. The connection string (e.g. starting with 'jdbc:snowflake://host[:port]/?[db=database]').
- user. The user name used to access the server.
- password. The password for that user.

### Windows authentication for SQL Server

To be able to use Windows authentication for SQL Server (and PDW), you have to install the JDBC driver. Download the version 9.2.0 .zip from [Microsoft](#) and extract its contents to a folder. In the extracted folder you will find the file sqljdbc\_9.2/enu/auth/x64/mssql-jdbc\_auth-9.2.0.x64.dll (64-bits) or sqljdbc\_9.2/enu/auth/x86/mssql-jdbc\_auth-9.2.0.x86.dll (32-bits), which needs to be moved to location on the system path, for example to c:/windows/system32. If you not have write access to any folder in the system path, you can also specify the path to the folder containing the dll by setting the environmental variable PATH\_TO\_AUTH\_DLL, so for example Sys.setenv("PATH\_TO\_AUTH\_DLL" = "c:/temp") Note that the environmental variable needs to be set before calling connect for the first time.

### Examples

```
## Not run:
conn <- connect(
  dbms = "postgresql",
  server = "localhost/postgres",
  user = "root",
  password = "xxx"
)
dbGetQuery(conn, "SELECT COUNT(*) FROM person")
disconnect(conn)

conn <- connect(dbms = "sql server", server = "RNDUSRDHIT06.jnj.com")
dbGetQuery(conn, "SELECT COUNT(*) FROM concept")
disconnect(conn)

conn <- connect(
  dbms = "oracle",
  server = "127.0.0.1/xe",
  user = "system",
  password = "xxx",
  pathToDriver = "c:/temp"
)
dbGetQuery(conn, "SELECT COUNT(*) FROM test_table")
disconnect(conn)

conn <- connect(
  dbms = "postgresql",
  connectionString = "jdbc:postgresql://127.0.0.1:5432/cmd_database"
```

```

)
dbGetQuery(conn, "SELECT COUNT(*) FROM person")
disconnect(conn)

## End(Not run)

```

---

createConnectionDetails

*createConnectionDetails*

---

## Description

createConnectionDetails creates a list containing all details needed to connect to a database. There are three ways to call this function:

- createConnectionDetails(dbms, user, password, server, port, extraSettings, oracleDriver, pathToDriver)
- createConnectionDetails(dbms, connectionString, pathToDriver)
- createConnectionDetails(dbms, connectionString, user, password, pathToDriver)

## Arguments

dbms	<p>The type of DBMS running on the server. Valid values are</p> <ul style="list-style-type: none"> <li>• "oracle" for Oracle</li> <li>• "postgresql" for PostgreSQL</li> <li>• "redshift" for Amazon Redshift</li> <li>• "sql server" for Microsoft SQL Server</li> <li>• "pdw" for Microsoft Parallel Data Warehouse (PDW)</li> <li>• "netezza" for IBM Netezza</li> <li>• "bigquery" for Google BigQuery</li> <li>• "sqlite" for SQLite</li> <li>• "sqlite extended" for SQLite with extended types (DATE and DATETIME)</li> <li>• "spark" for Spark</li> <li>• "snowflake" for Snowflake</li> </ul>
user	The user name used to access the server.
password	The password for that user.
server	The name of the server.
port	(optional) The port on the server to connect to.
extraSettings	(optional) Additional configuration settings specific to the database provider to configure things as security for SSL. These must follow the format for the JDBC connection for the RDBMS specified in dbms.
oracleDriver	Specify which Oracle drive you want to use. Choose between "thin" or "oci".
connectionString	The JDBC connection string. If specified, the server, port, extraSettings, and oracleDriver fields are ignored. If user and password are not specified, they are assumed to already be included in the connection string.
pathToDriver	Path to a folder containing the JDBC driver JAR files. See <a href="#">downloadJdbcDrivers</a> for instructions on how to download the relevant drivers.

## Details

This function creates a list containing all details needed to connect to a database. The list can then be used in the [connect](#) function.

## Value

A list with all the details needed to connect to a database.

## DBMS parameter details

Depending on the DBMS, the function arguments have slightly different interpretations: Oracle:

- user. The user name used to access the server
- password. The password for that user
- server. This field contains the SID, or host and servicename, SID, or TNSName: '<sid>', '<host>/<sid>', '<host>/<service name>', or '<tnsname>'
- port. Specifies the port on the server (default = 1521)
- extraSettings The configuration settings for the connection (i.e. SSL Settings such as "(PROTOCOL=tcp)")
- oracleDriver The driver to be used. Choose between "thin" or "oci".
- pathToDriver The path to the folder containing the Oracle JDBC driver JAR files.

Microsoft SQL Server:

- user. The user used to log in to the server. If the user is not specified, Windows Integrated Security will be used, which requires the SQL Server JDBC drivers to be installed (see details below).
- password. The password used to log on to the server
- server. This field contains the host name of the server
- port. Not used for SQL Server
- extraSettings The configuration settings for the connection (i.e. SSL Settings such as "encrypt=true; trustServerCertificate=false;")
- pathToDriver The path to the folder containing the SQL Server JDBC driver JAR files.

Microsoft PDW:

- user. The user used to log in to the server. If the user is not specified, Windows Integrated Security will be used, which requires the SQL Server JDBC drivers to be installed (see details below).
- password. The password used to log on to the server
- server. This field contains the host name of the server
- port. Not used for SQL Server
- extraSettings The configuration settings for the connection (i.e. SSL Settings such as "encrypt=true; trustServerCertificate=false;")
- pathToDriver The path to the folder containing the SQL Server JDBC driver JAR files.

PostgreSQL:

- user. The user used to log in to the server
- password. The password used to log on to the server

- **server.** This field contains the host name of the server and the database holding the relevant schemas: <host>/<database>
- **port.** Specifies the port on the server (default = 5432)
- **extraSettings** The configuration settings for the connection (i.e. SSL Settings such as "ssl=true")
- **pathToDriver** The path to the folder containing the PostgreSQL JDBC driver JAR files.

#### Redshift:

- **user.** The user used to log in to the server
- **password.** The password used to log on to the server
- **server.** This field contains the host name of the server and the database holding the relevant schemas: <host>/<database>
- **port.** Specifies the port on the server (default = 5439)
- **extraSettings** The configuration settings for the connection (i.e. SSL Settings such as "ssl=true&sslfactory=com.amazon.redshift.ssl.NonValidatingFactory")
- **pathToDriver** The path to the folder containing the RedShift JDBC driver JAR files.

#### Netezza:

- **user.** The user used to log in to the server
- **password.** The password used to log on to the server
- **server.** This field contains the host name of the server and the database holding the relevant schemas: <host>/<database>
- **port.** Specifies the port on the server (default = 5480)
- **extraSettings** The configuration settings for the connection (i.e. SSL Settings such as "ssl=true")
- **pathToDriver** The path to the folder containing the Netezza JDBC driver JAR file (nzjdbc.jar).

#### Impala:

- **user.** The user name used to access the server
- **password.** The password for that user
- **server.** The host name of the server
- **port.** Specifies the port on the server (default = 21050)
- **extraSettings** The configuration settings for the connection (i.e. SSL Settings such as "SSLKeyStorePwd=\*\*\*\*\*")
- **pathToDriver** The path to the folder containing the Impala JDBC driver JAR files.

#### SQLite:

- **server.** The path to the SQLite file.

#### Spark:

- **connectionString.** The connection string (e.g. starting with 'jdbc:spark://my-org.dev.cloud.databricks.com...').
- **user.** The user name used to access the server.
- **password.** The password for that user.

#### Snowflake:

- **connectionString.** The connection string (e.g. starting with 'jdbc:snowflake://host[:port]/?[db=database]').
- **user.** The user name used to access the server.
- **password.** The password for that user.

## Windows authentication for SQL Server

To be able to use Windows authentication for SQL Server (and PDW), you have to install the JDBC driver. Download the version 9.2.0 .zip from [Microsoft](#) and extract its contents to a folder. In the extracted folder you will find the file `sqljdbc_9.2/enu/auth/x64/mssql-jdbc_auth-9.2.0.x64.dll` (64-bits) or `sqljdbc_9.2/enu/auth/x86/mssql-jdbc_auth-9.2.0.x86.dll` (32-bits), which needs to be moved to location on the system path, for example to `c:/windows/system32`. If you not have write access to any folder in the system path, you can also specify the path to the folder containing the dll by setting the environmental variable `PATH_TO_AUTH_DLL`, so for example `Sys.setenv("PATH_TO_AUTH_DLL" = "c:/temp")`. Note that the environmental variable needs to be set before calling `connect` for the first time.

## Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost/postgres",
  user = "root",
  password = "blah"
)
conn <- connect(connectionDetails)
dbGetQuery(conn, "SELECT COUNT(*) FROM person")
disconnect(conn)

## End(Not run)
```

---

createZipFile

*Compress files and/or folders into a single zip file*

---

## Description

Compress files and/or folders into a single zip file

## Usage

```
createZipFile(zipFile, files, rootFolder = getwd(), compressionLevel = 9)
```

## Arguments

<code>zipFile</code>	The path to the zip file to be created.
<code>files</code>	The files and/or folders to be included in the zip file. Folders will be included recursively.
<code>rootFolder</code>	The root folder. All files will be stored with relative paths relative to this folder.
<code>compressionLevel</code>	A number between 1 and 9. 9 compresses best, but it also takes the longest.

## Details

Uses Java's compression library to create a zip file. It is similar to `utils::zip`, except that it does not require an external zip tool to be available on the system path.

---

DatabaseConnectorDriver

*Create a DatabaseConnectorDriver object*

---

### Description

Create a DatabaseConnectorDriver object

### Usage

```
DatabaseConnectorDriver()
```

---

dbConnect, DatabaseConnectorDriver-method

*Create a connection to a DBMS*

---

### Description

Connect to a database. This function is synonymous with the [connect](#) function. except a dummy driver needs to be specified

### Usage

```
## S4 method for signature 'DatabaseConnectorDriver'
dbConnect(drv, ...)
```

### Arguments

drv	The result of the <code>link{DatabaseConnectorDriver}</code> function
...	Other parameters. These are the same as expected by the <a href="#">connect</a> function.

### Value

Returns a DatabaseConnectorConnection object that can be used with most of the other functions in this package.

### Examples

```
## Not run:
conn <- dbConnect(DatabaseConnectorDriver(),
  dbms = "postgresql",
  server = "localhost/ohdsi",
  user = "joe",
  password = "secret"
)
querySql(conn, "SELECT * FROM cdm_synpuf.person;")
dbDisconnect(conn)

## End(Not run)
```

---

dbGetInfo, DatabaseConnectorDriver-method  
*Get DBMS metadata*

---

## Description

Retrieves information on objects of class [DBIDriver](#), [DBIConnection](#) or [DBIResult](#).

## Usage

```
## S4 method for signature 'DatabaseConnectorDriver'
dbGetInfo(dbObj, ...)
```

## Arguments

dbObj	An object inheriting from <a href="#">DBIObject</a> , i.e. <a href="#">DBIDriver</a> , <a href="#">DBIConnection</a> , or a <a href="#">DBIResult</a>
...	Other arguments to methods.

## Value

For objects of class [DBIDriver](#), `dbGetInfo()` returns a named list that contains at least the following components:

- `driver.version`: the package version of the DBI backend,
- `client.version`: the version of the DBMS client library.

For objects of class [DBIConnection](#), `dbGetInfo()` returns a named list that contains at least the following components:

- `db.version`: version of the database server,
- `dbname`: database name,
- `username`: username to connect to the database,
- `host`: hostname of the database server,
- `port`: port on the database server. It must not contain a password component. Components that are not applicable should be set to NA.

For objects of class [DBIResult](#), `dbGetInfo()` returns a named list that contains at least the following components:

- `statement`: the statement used with [dbSendQuery\(\)](#) or [dbExecute\(\)](#), as returned by [dbGetStatement\(\)](#),
- `row.count`: the number of rows fetched so far (for queries), as returned by [dbGetRowCount\(\)](#),
- `rows.affected`: the number of rows affected (for statements), as returned by [dbGetRowsAffected\(\)](#)
- `has.completed`: a logical that indicates if the query or statement has completed, as returned by [dbHasCompleted\(\)](#).

**See Also**

Other DBIDriver generics: [DBIDriver-class](#), [dbCanConnect\(\)](#), [dbConnect\(\)](#), [dbDataType\(\)](#), [dbDriver\(\)](#), [dbIsReadOnly\(\)](#), [dbIsValid\(\)](#), [dbListConnections\(\)](#)

Other DBIConnection generics: [DBIConnection-class](#), [dbAppendTable\(\)](#), [dbCreateTable\(\)](#), [dbDataType\(\)](#), [dbDisconnect\(\)](#), [dbExecute\(\)](#), [dbExistsTable\(\)](#), [dbGetException\(\)](#), [dbGetQuery\(\)](#), [dbIsReadOnly\(\)](#), [dbIsValid\(\)](#), [dbListFields\(\)](#), [dbListObjects\(\)](#), [dbListResults\(\)](#), [dbListTables\(\)](#), [dbReadTable\(\)](#), [dbRemoveTable\(\)](#), [dbSendQuery\(\)](#), [dbSendStatement\(\)](#), [dbWriteTable\(\)](#)

Other DBIResult generics: [DBIResult-class](#), [dbBind\(\)](#), [dbClearResult\(\)](#), [dbColumnInfo\(\)](#), [dbFetch\(\)](#), [dbGetRowCount\(\)](#), [dbGetRowsAffected\(\)](#), [dbGetStatement\(\)](#), [dbHasCompleted\(\)](#), [dbIsReadOnly\(\)](#), [dbIsValid\(\)](#), [dbQuoteIdentifier\(\)](#), [dbQuoteLiteral\(\)](#), [dbQuoteString\(\)](#), [dbUnquoteIdentifier\(\)](#)

---

dbms

---

*Get the database platform from a connection*

---

**Description**

The SqlRender package provides functions that translate SQL from OHDSI-SQL to a target SQL dialect. These function need the name of the database platform to translate to. The ‘dbms’ function returns the dbms for any DBI connection that can be passed along to SqlRender translation functions (see example).

**Usage**

```
dbms(connection)
```

**Arguments**

connection      A DBI (or DatabaseConnector) connection

**Value**

The name of the database (dbms) used by SqlRender

**Examples**

```
library(DatabaseConnector)
con <- connect(dbms = "sqlite", server = ":memory:")
dbms(con)
#> [1] "sqlite"
SqlRender::translate("DATEADD(d, 365, dateColumn)", targetDialect = dbms(con))
#> "CAST(STRFTIME('%s', DATETIME(dateColumn, 'unixepoch', (365)||' days')) AS REAL)"
disconnect(con)
```

---

`dbUnloadDriver, DatabaseConnectorDriver-method`*Load and unload database drivers*

---

## Description

These methods are deprecated, please consult the documentation of the individual backends for the construction of driver instances.

`dbDriver()` is a helper method used to create a new driver object given the name of a database or the corresponding R package. It works through convention: all DBI-extending packages should provide an exported object with the same name as the package. `dbDriver()` just looks for this object in the right places: if you know what database you are connecting to, you should call the function directly.

`dbUnloadDriver()` is not implemented for modern backends.

## Usage

```
## S4 method for signature 'DatabaseConnectorDriver'
dbUnloadDriver(drv, ...)
```

## Arguments

<code>drv</code>	an object that inherits from <code>DBIDriver</code> as created by <code>dbDriver</code> .
<code>...</code>	any other arguments are passed to the driver <code>drvName</code> .

## Details

The client part of the database communication is initialized (typically dynamically loading C code, etc.) but note that connecting to the database engine itself needs to be done through calls to `dbConnect`.

## Value

In the case of `dbDriver`, an driver object whose class extends `DBIDriver`. This object may be used to create connections to the actual DBMS engine.

In the case of `dbUnloadDriver`, a logical indicating whether the operation succeeded or not.

## See Also

Other `DBIDriver` generics: [DBIDriver-class](#), [dbCanConnect\(\)](#), [dbConnect\(\)](#), [dbDataType\(\)](#), [dbGetInfo\(\)](#), [dbIsReadOnly\(\)](#), [dbIsValid\(\)](#), [dbListConnections\(\)](#)

Other `DBIDriver` generics: [DBIDriver-class](#), [dbCanConnect\(\)](#), [dbConnect\(\)](#), [dbDataType\(\)](#), [dbGetInfo\(\)](#), [dbIsReadOnly\(\)](#), [dbIsValid\(\)](#), [dbListConnections\(\)](#)

---

disconnect	<i>Disconnect from the server</i>
------------	-----------------------------------

---

### Description

Close the connection to the server.

### Usage

```
disconnect(connection)
```

### Arguments

connection	The connection to the database server.
------------	--

### Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah"
)
conn <- connect(connectionDetails)
count <- querySql(conn, "SELECT COUNT(*) FROM person")
disconnect(conn)

## End(Not run)
```

---

downloadJdbcDrivers	<i>Download DatabaseConnector JDBC Jar files</i>
---------------------	--

---

### Description

Download the DatabaseConnector JDBC drivers from <https://ohdsi.github.io/DatabaseConnectorJars/>

### Usage

```
downloadJdbcDrivers(
  dbms,
  pathToDriver = Sys.getenv("DATABASECONNECTOR_JAR_FOLDER"),
  method = "auto",
  ...
)
```

**Arguments**

dbms	<p>The type of DBMS to download Jar files for.</p> <ul style="list-style-type: none"> <li>• "postgresql" for PostgreSQL</li> <li>• "redshift" for Amazon Redshift</li> <li>• "sql server", "pdw" or "synapse" for Microsoft SQL Server</li> <li>• "oracle" for Oracle</li> <li>• "spark" for Spark</li> <li>• "snowflake" for Snowflake</li> </ul>
pathToDriver	The full path to the folder where the JDBC driver .jar files should be downloaded to. By default the value of the environment variable "DATABASECONNECTOR_JAR_FOLDER" is used.
method	The method used for downloading files. See ?download.file for details and options.
...	Further arguments passed on to download.file

**Details**

The following versions of the JDBC drivers are currently used:

- PostgreSQLV42.2.18
- RedShiftV2.1.0.9
- SQL ServerV8.4.1.zip
- OracleV19.8
- SparkV2.6.21
- SnowflakeV3.13.22

**Value**

Invisibly returns the destination if the download was successful.

**Examples**

```
## Not run:
downloadJdbcDrivers("redshift")

## End(Not run)
```

---

dropEmulatedTempTables

*Drop all emulated temp tables.*

---

**Description**

On some DBMSs, like Oracle and BigQuery, DatabaseConnector through SqlRender emulates temp tables in a schema provided by the user. Ideally, these tables are deleted by the application / R script creating them, but for various reasons orphan temp tables may remain. This function drops all emulated temp tables created in this session only.

**Usage**

```
dropEmulatedTempTables(
  connection,
  tempEmulationSchema = getOption("sqlRenderTempEmulationSchema")
)
```

**Arguments**

**connection**      The connection to the database server.

**tempEmulationSchema**      Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.

**Value**

Invisibly returns the list of deleted emulated temp tables.

---

executeSql	<i>Execute SQL code</i>
------------	-------------------------

---

**Description**

This function executes SQL consisting of one or more statements.

**Usage**

```
executeSql(
  connection,
  sql,
  profile = FALSE,
  progressBar = !as.logical(Sys.getenv("TESTTHAT", unset = FALSE)),
  reportOverallTime = TRUE,
  errorReportFile = file.path(getwd(), "errorReportSql.txt"),
  runAsBatch = FALSE
)
```

**Arguments**

**connection**      The connection to the database server.

**sql**      The SQL to be executed

**profile**      When true, each separate statement is written to file prior to sending to the server, and the time taken to execute a statement is displayed.

**progressBar**      When true, a progress bar is shown based on the statements in the SQL code.

**reportOverallTime**      When true, the function will display the overall time taken to execute all statements.

**errorReportFile**      The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.

**runAsBatch** When true the SQL statements are sent to the server as a single batch, and executed there. This will be faster if you have many small SQL statements, but there will be no progress bar, and no per-statement error messages. If the database platform does not support batched updates the query is executed without batching.

## Details

This function splits the SQL in separate statements and sends it to the server for execution. If an error occurs during SQL execution, this error is written to a file to facilitate debugging. Optionally, a progress bar is shown and the total time taken to execute the SQL is displayed. Optionally, each separate SQL statement is written to file, and the execution time per statement is shown to aid in detecting performance issues.

## Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v4"
)
conn <- connect(connectionDetails)
executeSql(conn, "CREATE TABLE x (k INT); CREATE TABLE y (k INT);")
disconnect(conn)

## End(Not run)
```

---

existsTable

*Does the table exist?*

---

## Description

Checks whether a table exists. Accounts for surrounding escape characters. Case insensitive.

## Usage

```
existsTable(connection, databaseSchema, tableName)
```

## Arguments

**connection** The connection to the database server.  
**databaseSchema** The name of the database schema. See details for platform-specific details.  
**tableName** The name of the table to check.

## Details

The databaseSchema argument is interpreted differently according to the different platforms: SQL Server and PDW: The databaseSchema schema should specify both the database and the schema, e.g. 'my\_database.dbo'. Impala: the databaseSchema should specify the database. Oracle: The databaseSchema should specify the Oracle 'user'. All other : The databaseSchema should specify the schema.

**Value**

A logical value indicating whether the table exists.

---

extractQueryTimes	<i>Extract query times from a ParallelLogger log file</i>
-------------------	---

---

**Description**

When using the ParallelLogger default file logger, and using options(LOG\_DATABASECONNECTOR\_SQL = TRUE), DatabaseConnector will log all SQL sent to the server, and the time to get a response.

This function parses the log file, producing a data frame with time per query.

**Usage**

```
extractQueryTimes(logFileName)
```

**Arguments**

logFileName	Name of the ParallelLogger log file. Assumes the file was created using the default file logger.
-------------	--

**Value**

A data frame with queries and their run times in milliseconds.

**Examples**

```
connection <- connect(dbms = "sqlite", server = ":memory:")
logFile <- tempfile(fileext = ".log")
ParallelLogger::addDefaultFileLogger(fileName = logFile, name = "MY_LOGGER")
options(LOG_DATABASECONNECTOR_SQL = TRUE)

executeSql(connection, "CREATE TABLE test (x INT);")
querySql(connection, "SELECT * FROM test;")

extractQueryTimes(logFile)

ParallelLogger::unregisterLogger("MY_LOGGER")
unlink(logFile)
disconnect(connection)
```

---

getAvailableJavaHeapSpace	<i>Get available Java heap space</i>
---------------------------	--------------------------------------

---

**Description**

For debugging purposes: get the available Java heap space.

**Usage**

```
getAvailableJavaHeapSpace()
```

**Value**

The Java heap space (in bytes).

---

getTableNames	<i>List all tables in a database schema.</i>
---------------	--

---

**Description**

This function returns a list of all tables in a database schema.

**Usage**

```
getTableNames(connection, databaseSchema, cast = "lower")
```

**Arguments**

connection	A DBI connection to the database server.
databaseSchema	The name of the database schema. See details for platform-specific details.
cast	Should the table names be cast to uppercase or lowercase before being returned? Valid options are "upper" , "lower" (default), "none" (no casting is done)

**Details**

The databaseSchema argument is interpreted differently according to the different platforms: SQL Server and PDW: The databaseSchema schema should specify both the database and the schema, e.g. 'my\_database.dbo'. Impala: the databaseSchema should specify the database. Oracle: The databaseSchema should specify the Oracle 'user'. All other : The databaseSchema should specify the schema.

**Value**

A character vector of table names.

---

inDatabaseSchema	<i>Refer to a table in a database schema</i>
------------------	--

---

### Description

Can be used with `dplyr::tbl()` to indicate a table in a specific database schema.

### Usage

```
inDatabaseSchema(databaseSchema, table)
```

### Arguments

databaseSchema	The name of the database schema. For example, for SQL Server this can be 'cdm.dbo'.
table	The name of the table in the database schema.

### Value

An object representing the table and database schema.

---

insertTable	<i>Insert a table on the server</i>
-------------	-------------------------------------

---

### Description

This function sends the data in a data frame to a table on the server. Either a new table is created, or the data is appended to an existing table.

### Usage

```
insertTable(
  connection,
  databaseSchema = NULL,
  tableName,
  data,
  dropTableIfExists = TRUE,
  createTable = TRUE,
  tempTable = FALSE,
  oracleTempSchema = NULL,
  tempEmulationSchema = getOption("sqlRenderTempEmulationSchema"),
  bulkLoad = Sys.getenv("DATABASE_CONNECTOR_BULK_UPLOAD"),
  useMppBulkLoad = Sys.getenv("USE_MPP_BULK_LOAD"),
  progressBar = FALSE,
  camelCaseToSnakeCase = FALSE
)
```

**Arguments**

connection	The connection to the database server.
databaseSchema	(Optional) The name of the database schema where the table should be located.
tableName	The name of the table where the data should be inserted.
data	The data frame containing the data to be inserted.
dropTableIfExists	Drop the table if the table already exists before writing?
createTable	Create a new table? If false, will append to existing table.
tempTable	Should the table created as a temp table?
oracleTempSchema	DEPRECATED: use tempEmulationSchema instead.
tempEmulationSchema	Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.
bulkLoad	If using Redshift, PDW, Hive or Postgres, use more performant bulk loading techniques. Does not work for temp tables (except for HIVE). See Details for requirements for the various platforms.
useMppBulkLoad	DEPRECATED. Use bulkLoad instead.
progressBar	Show a progress bar when uploading?
camelCaseToSnakeCase	If TRUE, the data frame column names are assumed to use camelCase and are converted to snake_case before uploading.

**Details**

This function sends the data in a data frame to a table on the server. Either a new table is created, or the data is appended to an existing table. NA values are inserted as null values in the database.

Bulk uploading:

Redshift: The MPP bulk loading relies upon the CloudyR S3 library to test a connection to an S3 bucket using AWS S3 credentials. Credentials are configured directly into the System Environment using the following keys: Sys.setenv("AWS\_ACCESS\_KEY\_ID" = "some\_access\_key\_id", "AWS\_SECRET\_ACCESS\_KEY" = "some\_secret\_access\_key", "AWS\_DEFAULT\_REGION" = "some\_aws\_region", "AWS\_BUCKET\_NAME" = "some\_bucket\_name", "AWS\_OBJECT\_KEY" = "some\_object\_key", "AWS\_SSE\_TYPE" = "server\_side\_encryption\_type").

PDW: The MPP bulk loading relies upon the client having a Windows OS and the DWLoader exe installed, and the following permissions granted: –Grant BULK Load permissions - needed at a server level USE master; GRANT ADMINISTER BULK OPERATIONS TO user; –Grant Staging database permissions - we will use the user db. USE scratch; EXEC sp\_addrolemember 'db\_ddladmin', user; Set the R environment variable DWLOADER\_PATH to the location of the binary.

PostgreSQL: Uses the 'pg' executable to upload. Set the POSTGRES\_PATH environment variable to the Postgres binary path, e.g. 'C:/Program Files/PostgreSQL/11/bin'.

## Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "mysql",
  server = "localhost",
  user = "root",
  password = "blah"
)
conn <- connect(connectionDetails)
data <- data.frame(x = c(1, 2, 3), y = c("a", "b", "c"))
insertTable(conn, "my_schema", "my_table", data)
disconnect(conn)

## bulk data insert with Redshift or PDW
connectionDetails <- createConnectionDetails(
  dbms = "redshift",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v5"
)
conn <- connect(connectionDetails)
data <- data.frame(x = c(1, 2, 3), y = c("a", "b", "c"))
insertTable(
  connection = connection,
  databaseSchema = "scratch",
  tableName = "somedata",
  data = data,
  dropTableIfExists = TRUE,
  createTable = TRUE,
  tempTable = FALSE,
  bulkLoad = TRUE
) # or, Sys.setenv("DATABASE_CONNECTOR_BULK_UPLOAD" = TRUE)

## End(Not run)
```

---

isSqlReservedWord

*Test a character vector of SQL names for SQL reserved words*

---

## Description

This function checks a character vector against a predefined list of reserved SQL words.

## Usage

```
isSqlReservedWord(sqlNames, warn = FALSE)
```

## Arguments

sqlNames	A character vector containing table or field names to check.
warn	(logical) Should a warn be thrown if invalid SQL names are found?

**Value**

A logical vector with length equal to sqlNames that is TRUE for each name that is reserved and FALSE otherwise

---

jdbcDrivers	<i>How to download and use JDBC drivers for the various data platforms.</i>
-------------	---

---

**Description**

Below are instructions for downloading JDBC drivers for the various data platforms. Once downloaded use the pathToDriver argument in the [connect](#) or [createConnectionDetails](#) functions to point to the driver. Alternatively, you can set the 'DATABASECONNECTOR\_JAR\_FOLDER' environmental variable, for example in your .Renv file (recommended).

**SQL Server, Oracle, PostgreSQL, PDW, Snowflake, Spark RedShift, Azure Synapse**

Use the [downloadJdbcDrivers](#) function to download these drivers from the OHDSI GitHub pages.

**Netezza**

Read the instructions [here](#) on how to obtain the Netezza JDBC driver.

**BigQuery**

Go to [Google's site](#) and download the latest JDBC driver. Unzip the file, and locate the appropriate jar files.

**Impala**

Go to [Cloudera's site](#), pick your OS version, and click "GET IT NOW!". Register, and you should be able to download the driver.

**SQLite**

For SQLite we actually don't use a JDBC driver. Instead, we use the RSQLite package, which can be installed using `install.packages("RSQLite")`.

---

lowLevelExecuteSql	<i>Execute SQL code</i>
--------------------	-------------------------

---

**Description**

This function executes a single SQL statement.

**Usage**

```
lowLevelExecuteSql(connection, sql)
```

**Arguments**

connection	The connection to the database server.
sql	The SQL to be executed

---

lowLevelQuerySql	<i>Low level function for retrieving data to a data frame</i>
------------------	---

---

**Description**

This is the equivalent of the [querySql](#) function, except no error report is written when an error occurs.

**Usage**

```
lowLevelQuerySql(
  connection,
  query,
  datesAsString = FALSE,
  integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
  integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE)
)
```

**Arguments**

connection	The connection to the database server.
query	The SQL statement to retrieve the data
datesAsString	Logical: Should dates be imported as character vectors, or should they be converted to R's date format?
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.
integer64AsNumeric	Logical: should 64-bit integers be converted to numeric (double) values? If FALSE 64-bit integers will be represented using <code>bit64::integer64</code> .

**Details**

Retrieves data from the database server and stores it in a data frame. Null values in the database are converted to NA values in R.

**Value**

A data frame containing the data retrieved from the server

---

lowLevelQuerySqlToAndromeda

*Low level function for retrieving data to a local Andromeda object*

---

## Description

This is the equivalent of the [querySqlToAndromeda](#) function, except no error report is written when an error occurs.

## Usage

```
lowLevelQuerySqlToAndromeda(
  connection,
  query,
  andromeda,
  andromedaTableName,
  datesAsString = FALSE,
  integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
  integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE)
)
```

## Arguments

connection	The connection to the database server.
query	The SQL statement to retrieve the data
andromeda	An open Andromeda object, for example as created using <a href="#">andromeda</a> .
andromedaTableName	The name of the table in the local Andromeda object where the results of the query will be stored.
datesAsString	Should dates be imported as character vectors, or should they be converted to R's date format?
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.
integer64AsNumeric	Logical: should 64-bit integers be converted to numeric (double) values? If FALSE 64-bit integers will be represented using <code>bit64::integer64</code> .

## Details

Retrieves data from the database server and stores it in a local Andromeda object. This allows very large data sets to be retrieved without running out of memory. Null values in the database are converted to NA values in R. If a table with the same name already exists in the local Andromeda object it is replaced.

## Value

Invisibly returns the andromeda. The Andromeda object will have a table added with the query results.

---

querySql	<i>Retrieve data to a data.frame</i>
----------	--------------------------------------

---

## Description

This function sends SQL to the server, and returns the results.

## Usage

```
querySql(
  connection,
  sql,
  errorReportFile = file.path(getwd(), "errorReportSql.txt"),
  snakeCaseToCamelCase = FALSE,
  integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
  integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE)
)
```

## Arguments

connection	The connection to the database server.
sql	The SQL to be send.
errorReportFile	The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.
snakeCaseToCamelCase	If true, field names are assumed to use snake_case, and are converted to camel-Case.
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.
integer64AsNumeric	Logical: should 64-bit integers be converted to numeric (double) values? If FALSE 64-bit integers will be represented using bit64::integer64.

## Details

This function sends the SQL to the server and retrieves the results. If an error occurs during SQL execution, this error is written to a file to facilitate debugging. Null values in the database are converted to NA values in R.

## Value

A data frame.

## Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
```

```

    user = "root",
    password = "blah",
    schema = "cdm_v4"
  )
  conn <- connect(connectionDetails)
  count <- querySql(conn, "SELECT COUNT(*) FROM person")
  disconnect(conn)

## End(Not run)

```

---

querySqlToAndromeda      *Retrieves data to a local Andromeda object*

---

## Description

This function sends SQL to the server, and returns the results in a local Andromeda object

## Usage

```

querySqlToAndromeda(
  connection,
  sql,
  andromeda,
  andromedaTableName,
  errorReportFile = file.path(getwd(), "errorReportSql.txt"),
  snakeCaseToCamelCase = FALSE,
  integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
  integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE)
)

```

## Arguments

connection	The connection to the database server.
sql	The SQL to be sent.
andromeda	An open connection to a Andromeda object, for example as created using <a href="#">andromeda</a> .
andromedaTableName	The name of the table in the local Andromeda object where the results of the query will be stored.
errorReportFile	The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.
snakeCaseToCamelCase	If true, field names are assumed to use snake_case, and are converted to camel-Case.
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.
integer64AsNumeric	Logical: should 64-bit integers be converted to numeric (double) values? If FALSE 64-bit integers will be represented using bit64::integer64.

**Details**

Retrieves data from the database server and stores it in a local Andromeda object. This allows very large data sets to be retrieved without running out of memory. If an error occurs during SQL execution, this error is written to a file to facilitate debugging. Null values in the database are converted to NA values in R. If a table with the same name already exists in the local Andromeda object it is replaced.

**Value**

Invisibly returns the andromeda. The Andromeda object will have a table added with the query results.

**Examples**

```
## Not run:
andromeda <- Andromeda::andromeda()
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v4"
)
conn <- connect(connectionDetails)
querySqlToAndromeda(
  connection = conn,
  sql = "SELECT * FROM person;",
  andromeda = andromeda,
  andromedaTableName = "foo"
)
disconnect(conn)

andromeda$foo

## End(Not run)
```

---

renderTranslateExecuteSql

*Render, translate, execute SQL code*

---

**Description**

This function renders, translates, and executes SQL consisting of one or more statements.

**Usage**

```
renderTranslateExecuteSql(
  connection,
  sql,
  profile = FALSE,
  progressBar = TRUE,
  reportOverallTime = TRUE,
```

```

    errorReportFile = file.path(getwd(), "errorReportSql.txt"),
    runAsBatch = FALSE,
    oracleTempSchema = NULL,
    tempEmulationSchema = getOption("sqlRenderTempEmulationSchema"),
    ...
)

```

## Arguments

connection	The connection to the database server.
sql	The SQL to be executed
profile	When true, each separate statement is written to file prior to sending to the server, and the time taken to execute a statement is displayed.
progressBar	When true, a progress bar is shown based on the statements in the SQL code.
reportOverallTime	When true, the function will display the overall time taken to execute all statements.
errorReportFile	The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.
runAsBatch	When true the SQL statements are sent to the server as a single batch, and executed there. This will be faster if you have many small SQL statements, but there will be no progress bar, and no per-statement error messages. If the database platform does not support batched updates the query is executed as ordinarily.
oracleTempSchema	DEPRECATED: use tempEmulationSchema instead.
tempEmulationSchema	Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.
...	Parameters that will be used to render the SQL.

## Details

This function calls the render and translate functions in the SqlRender package before calling [executeSql](#).

## Examples

```

## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v4"
)
conn <- connect(connectionDetails)
renderTranslateExecuteSql(connection,
  sql = "SELECT * INTO #temp FROM @schema.person;",
  schema = "cdm_synpuf"
)

```

```
disconnect(conn)
```

```
## End(Not run)
```

---

```
renderTranslateQueryApplyBatched
```

*Render, translate, and perform process to batches of data.*

---

## Description

This function renders, and translates SQL, sends it to the server, processes the data in batches with a call back function. Note that this function should perform a row-wise operation. This is designed to work with massive data that won't fit in to memory.

The batch sizes are determined by the java virtual machine and will depend on the data.

## Usage

```
renderTranslateQueryApplyBatched(
  connection,
  sql,
  fun,
  args = list(),
  errorReportFile = file.path(getwd(), "errorReportSql.txt"),
  snakeCaseToCamelCase = FALSE,
  tempEmulationSchema = getOption("sqlRenderTempEmulationSchema"),
  integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
  integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE),
  ...
)
```

## Arguments

connection	The connection to the database server.
sql	The SQL to be send.
fun	Function to apply to batch. Must take data.frame and integer position as parameters.
args	List of arguments to be passed to function call.
errorReportFile	The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.
snakeCaseToCamelCase	If true, field names are assumed to use snake_case, and are converted to camel-Case.
tempEmulationSchema	Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.

```
integer64AsNumeric
    Logical: should 64-bit integers be converted to numeric (double) values? If
    FALSE 64-bit integers will be represented using bit64::integer64.
...
    Parameters that will be used to render the SQL.
```

## Details

This function calls the render and translate functions in the SqlRender package before calling [querySql](#).

## Value

Invisibly returns a list of outputs from each call to the provided function.

## Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v4"
)
connection <- connect(connectionDetails)

# First example: write data to a large CSV file:
filepath <- "myBigFile.csv"
writeBatchesToCsv <- function(data, position, ...) {
  write.csv(data, filepath, append = position != 1)
  return(NULL)
}
renderTranslateQueryApplyBatched(connection,
  "SELECT * FROM @schema.person;",
  schema = "cdm_synpuf",
  fun = writeBatchesToCsv
)

# Second example: write data to Andromeda
# (Alternative to querySqlToAndromeda if some local computation needs to be applied)
bigResults <- Andromeda::andromeda()
writeBatchesToAndromeda <- function(data, position, ...) {
  data$p <- EmpiricalCalibration::computeTraditionalP(data$logRr, data$logSeRr)
  if (position == 1) {
    bigResults$rrs <- data
  } else {
    Andromeda::appendToTable(bigResults$rrs, data)
  }
  return(NULL)
}
sql <- "SELECT target_id, comparator_id, log_rr, log_se_rr FROM @schema.my_results;"
renderTranslateQueryApplyBatched(connection,
  sql,
  fun = writeBatchesToAndromeda,
  schema = "my_results",
  snakeCaseToCamelCase = TRUE
```

```

)

disconnect(connection)

## End(Not run)

```

---

```
renderTranslateQuerySql
```

*Render, translate, and query to data.frame*

---

## Description

This function renders, and translates SQL, sends it to the server, and returns the results as a data.frame.

## Usage

```

renderTranslateQuerySql(
  connection,
  sql,
  errorReportFile = file.path(getwd(), "errorReportSql.txt"),
  snakeCaseToCamelCase = FALSE,
  oracleTempSchema = NULL,
  tempEmulationSchema = getOption("sqlRenderTempEmulationSchema"),
  integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
  integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE),
  ...
)

```

## Arguments

connection	The connection to the database server.
sql	The SQL to be send.
errorReportFile	The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.
snakeCaseToCamelCase	If true, field names are assumed to use snake_case, and are converted to camel-Case.
oracleTempSchema	DEPRECATED: use tempEmulationSchema instead.
tempEmulationSchema	Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.

```
integer64AsNumeric
    Logical: should 64-bit integers be converted to numeric (double) values? If
    FALSE 64-bit integers will be represented using bit64::integer64.
...
    Parameters that will be used to render the SQL.
```

### Details

This function calls the render and translate functions in the SqlRender package before calling [querySql](#).

### Value

A data frame.

### Examples

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v4"
)
conn <- connect(connectionDetails)
persons <- renderTranslatequerySql(conn,
  sql = "SELECT TOP 10 * FROM @schema.person",
  schema = "cdm_synpuf"
)
disconnect(conn)

## End(Not run)
```

---

renderTranslateQuerySqlToAndromeda

*Render, translate, and query to local Andromeda*

---

### Description

This function renders, and translates SQL, sends it to the server, and returns the results as an `ffdf` object

### Usage

```
renderTranslateQuerySqlToAndromeda(
  connection,
  sql,
  andromeda,
  andromedaTableName,
  errorReportFile = file.path(getwd(), "errorReportSql.txt"),
  snakeCaseToCamelCase = FALSE,
  oracleTempSchema = NULL,
  tempEmulationSchema = getOption("sqlRenderTempEmulationSchema"),
```

```

integerAsNumeric = getOption("databaseConnectorIntegerAsNumeric", default = TRUE),
integer64AsNumeric = getOption("databaseConnectorInteger64AsNumeric", default = TRUE),
...
)

```

### Arguments

connection	The connection to the database server.
sql	The SQL to be send.
andromeda	An open Andromeda object, for example as created using <a href="#">andromeda</a> .
andromedaTableName	The name of the table in the local Andromeda object where the results of the query will be stored.
errorReportFile	The file where an error report will be written if an error occurs. Defaults to 'errorReportSql.txt' in the current working directory.
snakeCaseToCamelCase	If true, field names are assumed to use snake_case, and are converted to camel-Case.
oracleTempSchema	DEPRECATED: use tempEmulationSchema instead.
tempEmulationSchema	Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.
integerAsNumeric	Logical: should 32-bit integers be converted to numeric (double) values? If FALSE 32-bit integers will be represented using R's native Integer class.
integer64AsNumeric	Logical: should 64-bit integers be converted to numeric (double) values? If FALSE 64-bit integers will be represented using bit64::integer64.
...	Parameters that will be used to render the SQL.

### Details

This function calls the render and translate functions in the SqlRender package before calling [querySqlToAndromeda](#).

### Value

Invisibly returns the andromeda. The Andromeda object will have a table added with the query results.

### Examples

```

## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresql",
  server = "localhost",
  user = "root",
  password = "blah",
  schema = "cdm_v4"
)

```

```

)
conn <- connect(connectionDetails)
renderTranslatequerySqlToAndromeda(conn,
  sql = "SELECT * FROM @schema.person",
  schema = "cdm_synpuf",
  andromeda = andromeda,
  andromedaTableName = "foo"
)
disconnect(conn)

andromeda$foo

## End(Not run)

```

---

requiresTempEmulation *Does the DBMS require temp table emulation?*

---

### Description

Does the DBMS require temp table emulation?

### Usage

```
requiresTempEmulation(dbms)
```

### Arguments

dbms	The type of DBMS running on the server. See [connect()] or [createConnectionDetails()] for valid values.
------	--

### Value

TRUE if the DBMS requires temp table emulation, FALSE otherwise.

### Examples

```

requiresTempEmulation("postgresql")
requiresTempEmulation("oracle")

```

---

show, DatabaseConnectorDriver-method  
*Show an Object*

---

### Description

Display the object, by printing, plotting or whatever suits its class. This function exists to be specialized by methods. The default method calls [showDefault](#).

Formal methods for show will usually be invoked for automatic printing (see the details).

**Usage**

```
## S4 method for signature 'DatabaseConnectorDriver'  
show(object)
```

**Arguments**

object	Any R object
--------	--------------

**Details**

Objects from an S4 class (a class defined by a call to [setClass](#)) will be displayed automatically if by a call to `show`. S4 objects that occur as attributes of S3 objects will also be displayed in this form; conversely, S3 objects encountered as slots in S4 objects will be printed using the S3 convention, as if by a call to [print](#).

Methods defined for `show` will only be inherited by simple inheritance, since otherwise the method would not receive the complete, original object, with misleading results. See the `simpleInheritanceOnly` argument to [setGeneric](#) and the discussion in [setIs](#) for the general concept.

**Value**

`show` returns an invisible `NULL`.

**See Also**

[showMethods](#) prints all the methods for one or more functions.
